		06/18/2007	PAPER	

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

<b>Office Action Summary</b>	<b>Application No.</b>	<b>Applicant(s)</b>
	10/726,651	ROBELET, MARC
	<b>Examiner</b>	<b>Art Unit</b>
	Marguerite J. McMahon	3747

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

#### Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

#### Status

- 1) Responsive to communication(s) filed on \_\_\_\_\_.
- 2a) This action is **FINAL**.                    2b) This action is non-final.
- 3) Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

#### Disposition of Claims

- 4) Claim(s) 1,17-22 and 26 is/are pending in the application.
  - 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) Claim(s) \_\_\_\_\_ is/are allowed.
- 6) Claim(s) 1,17-22 and 26 is/are rejected.
- 7) Claim(s) \_\_\_\_\_ is/are objected to.
- 8) Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

#### Application Papers

- 9) The specification is objected to by the Examiner.
- 10) The drawing(s) filed on \_\_\_\_\_ is/are: a) accepted or b) objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

#### Priority under 35 U.S.C. § 119

- 12) Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
  - a) All    b) Some \* c) None of:
    1. Certified copies of the priority documents have been received.
    2. Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
    3. Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

**DETAILED ACTION*****Claim Rejections - 35 USC § 103***

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1, 17-22, and 26 are rejected under 35 U.S.C. 103(a) as being unpatentable over Tausig et al (6,311,759) in view of Kemnitz (5,7778,533). Tausig et al teach that it is known to employ thixoforging to make articles which were previously formed by forging. Tausig et al describe the process of thixoforging an engine part such as a clutch hub, as an example. Tausig et al discuss the advantages that thixoforging has over conventional forging, and cites the following: "The forming stresses are up to four orders of magnitude lower in the semisolid state for thixotropic materials. It follows that more intricately shaped components can be formed in a single step to net or near net shape. In relation to conventional forging in particular, this also means that parts can be manufactured faster with a smaller number of processing steps and using smaller presses. Thixoforming also permits the shaping of otherwise unforgeable alloys." (See column 2, lines 5-13 of Tausig et al). "Another obviously important variable is the applied load necessary for the deforming (shaping) of the semisolid charge, and this may be several orders of magnitude less in thixoforming than is required in conventional forging" (See column 9, lines 12-17 of Tausig et al). Note that Tausig et al consider thixoforging to be a type of thixoforming.

Tausig et al show everything except utilizing the method of manufacture to form a piston, and some of the alloys claimed. Tausig et al show that it is old to employ stainless steel employing most of the elements claimed in claim 18 in similar percentages by weight (see Table 1), as well as an alloy based on Fe-Ni (as claimed in claim 24) or an alloy based on Ni-Col (as claimed in claim 25). See the end of Table 1. Tausig et al also maintain that a large number of metal alloys may be used in the process (see column 5, lines 1-2). Note that it has been held to be within the general skill of a worker in the art to select a known material on the basis of its suitability for the intended use as a matter of obvious design choice. *In re Leshin*, 125 USPQ 416.

Kemnitz shows a one-piece steel piston formed by conventional forging. The problems solved by employing the thixoforging method are problems, which are confronted by any article of manufacture, such as a piston, which is made by conventional forging, and include requiring many steps, much force, and being limited as to choice of alloys. Thus, it would have been obvious to one having ordinary skill in the art to adapt the process of thixoforging to make a piston. Pistons formed by forging are conventional, as shown by Kemnitz, and the process of utilizing the process of thixoforging is a relatively new, but known alternative to forging. Thus, there is no inventive step involved in adapting this known process to make a piston, instead of employing the conventional process of forging to make the piston, since it solves some of the problems of conventional forging techniques, such as providing the ability to make the piston in a process that requires fewer steps, with less force, and thus can be made more quickly, and utilizing a larger variety of alloys. In addition, with respect to

Art Unit: 3747

claims 17-22, it would have been obvious to one having ordinary skill in the art to utilize the various alloys cited, since it has been held to be within the general skill of a worker in the art to select a known material on the basis of its suitability for the intended use as a matter of obvious design choice. *In re Leshin*, 125 USPQ 416.

***Response to Arguments***

Applicant's arguments filed 3/26/07 have been fully considered but they are not persuasive.

Applicant argues that Tausig et al deals substantially only with light alloys and only mentions steel briefly as an example of a material which could be utilized, and that the fact that the independent claims 1 and 26 cite the use of steel renders them patentable distinct over Tausig et al. Tausig et al state in the first paragraph of column 5 that "A large number of metal alloys may be used in the process of the present invention. Examples include aluminum alloys, magnesium alloys, copper alloys, ferrous alloys [such as steel], and super-alloys. This list is not exhaustive. Preferred alloys for use in the present invention include those shown in Table 1:" Various types of steels are listed in the table which follows. It has been held to be within the general skill of a worker in the art to select a known material on the basis of its suitability for the intended use as a matter of obvious design choice. *In re Leshin*, 125 USPQ 416. Given that the selection of a known material is not a patentably distinct feature in general, and that the Tausig reference contemplates the use of the material in question, this argument is not found to be convincing.

Art Unit: 3747

Applicant spends some pages analyzing the process utilized in Tausig et al, and implies that the process would not work with steel. However, the Tausig et al reference itself acknowledges that steel would be an appropriate material for the process shown in Tausig et al. Applicant has not convinced the examiner that the thixoforging process could not be adapted to select the use of a known material, such as steel, particularly given its specific mention in the Tausig et al reference.

Applicant further argues that claim 26 recites that the globular primary structure of the steel material is obtained without an operation of globalization separate from the casting, cooling and heating, and that this distinguishes it over Tausig et al. Actually, this is not true. The casting process entails heating the material to a temperature hot enough to be cast. Tausig et al teach heating the material such that it is cast at a temperature which is in a range of the liquidus temperature to about 5 degrees C above the liquidus temperature, and most preferably at the liquidus temperature, and it is during this casting step that the globalization takes place (see lines 50-57, of column 4, which cite that "The solidified metal produced from the casting of the molten metal and subsequent solidification is preferably in the form of a billet or ingot. The solidified metal has been found to have an **as-cast microstructure that contains independent globules** separated by a phase of lower melting point material (normally eutectic phase).")

Applicant further argues that Kemnitz does not show features which it was not relied upon to show. In response to applicant's arguments against the references individually, one cannot show nonobviousness by attacking references individually

Art Unit: 3747

where the rejections are based on combinations of references. See *In re Keller*, 642 F.2d 413, 208 USPQ 871 (CCPA 1981); *In re Merck & Co.*, 800 F.2d 1091, 231 USPQ 375 (Fed. Cir. 1986).

### **Conclusion**

Note also the previously cited reference of Winter et al (4,457,355). Winter et al mention several materials as possibilities for the thixoforging pocess at column 11, lines 60-64, which recite: "The process and apparatus of this invention is applicable to the full range of materials as set forth in the prior art including but not limited to aluminum and its alloys, copper and its alloys and steel and its alloys."

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Marguerite J. McMahon whose telephone number is 571-272-4848. The examiner can normally be reached on Monday-Wednesday and Friday, 10am-6:30pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Steve Cronin can be reached on 571-272-4536. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
